Section: B

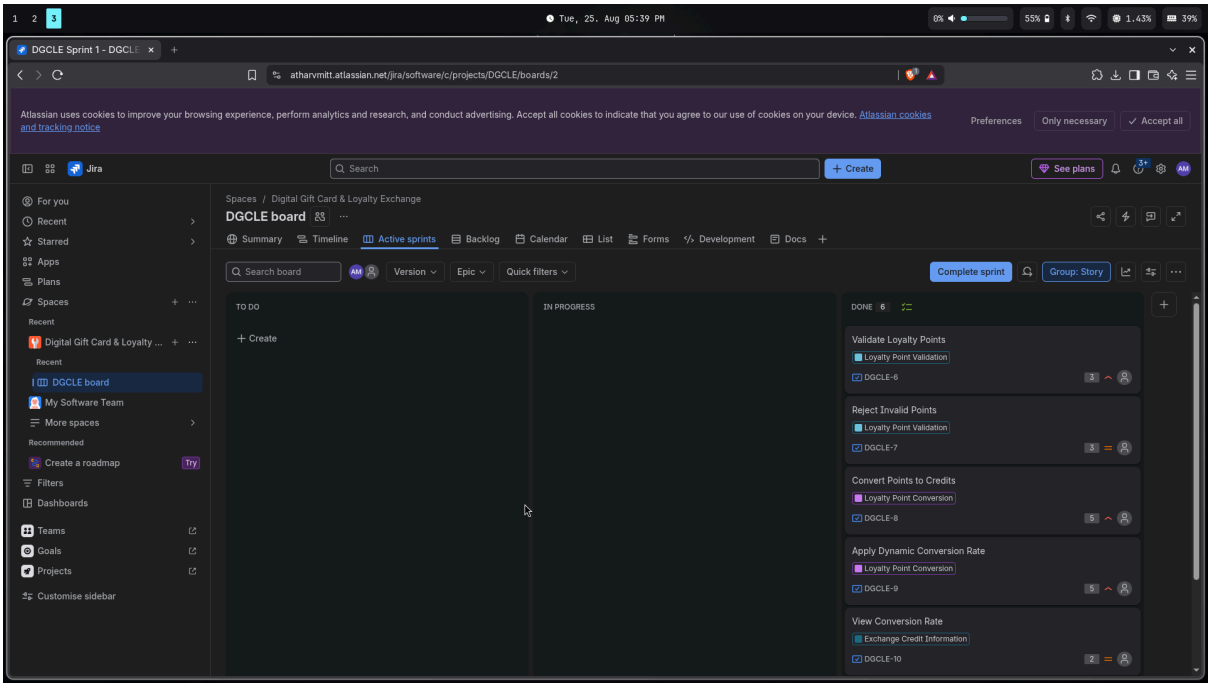

Epics/User Stories, Backlogs, Story Points creation:

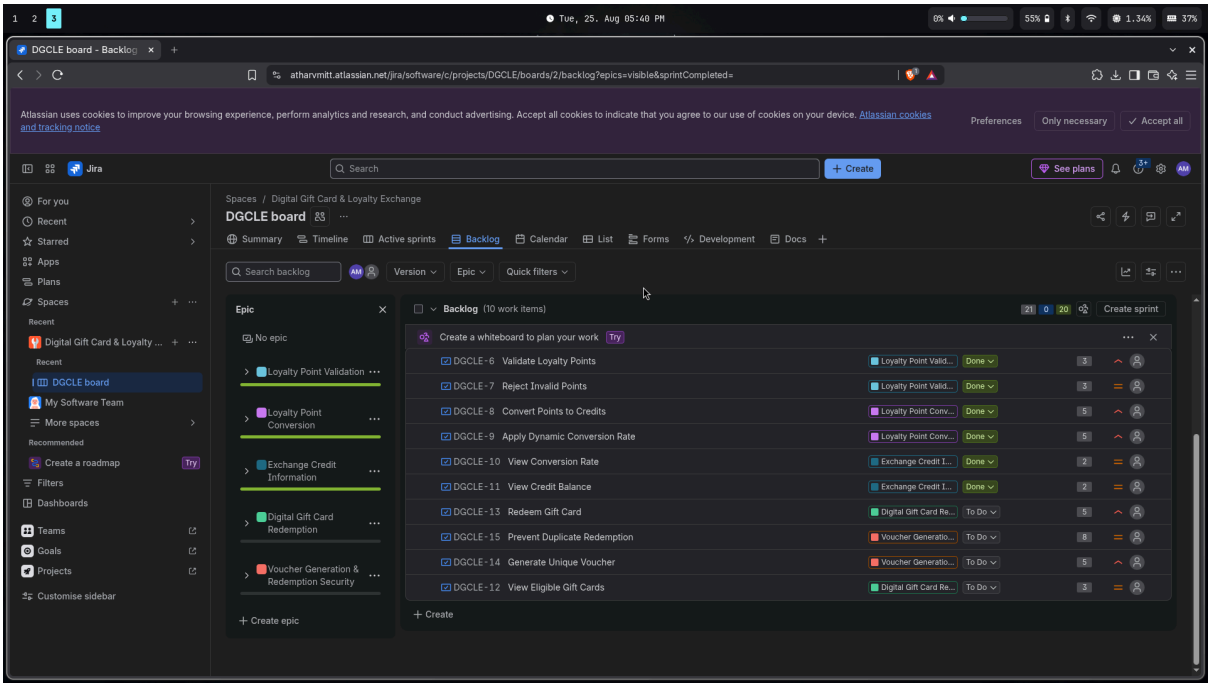

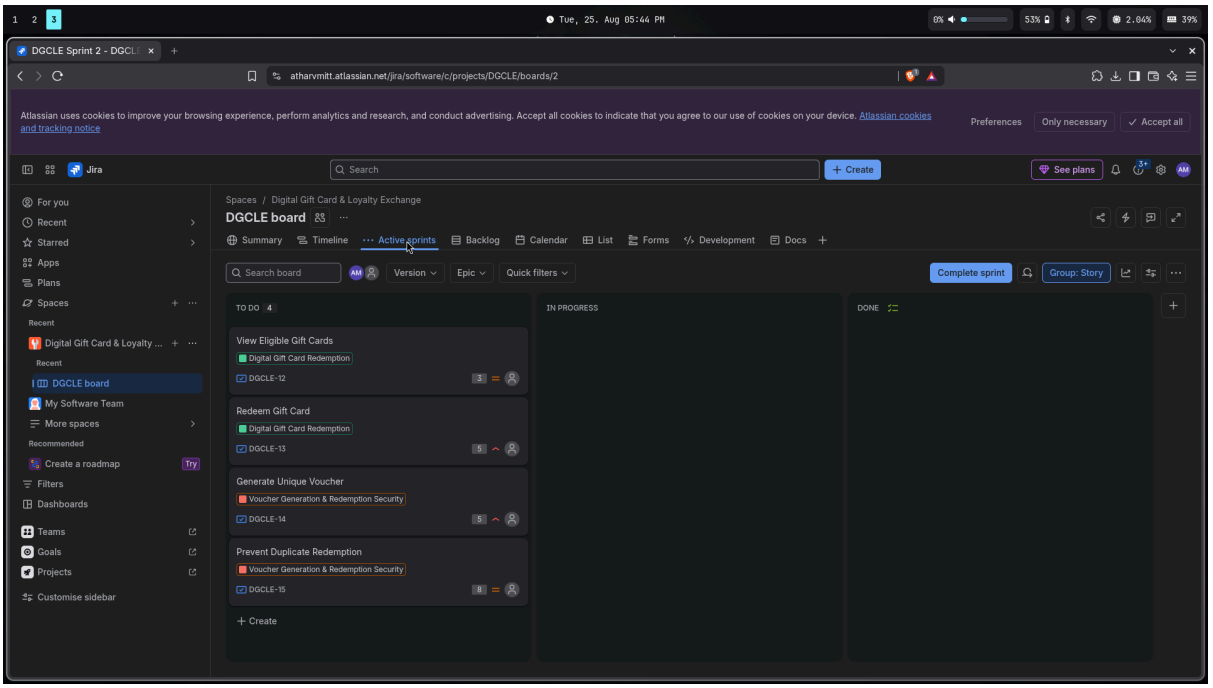

Active Sprint Board during Sprint 1:

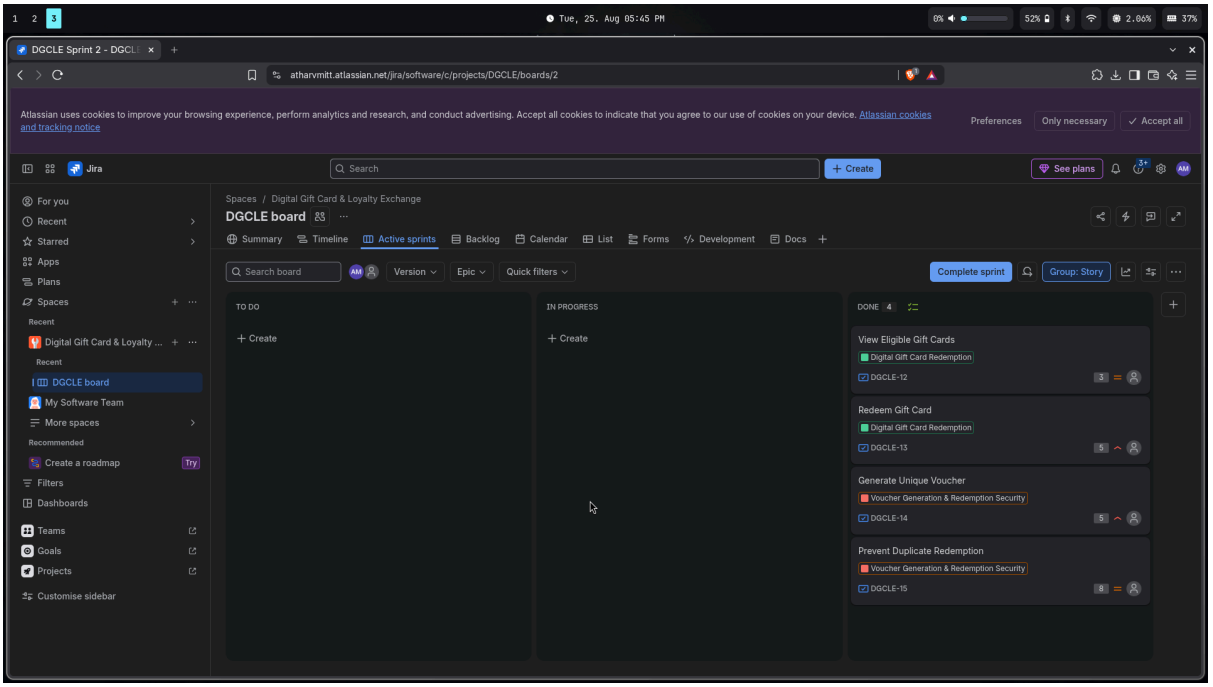

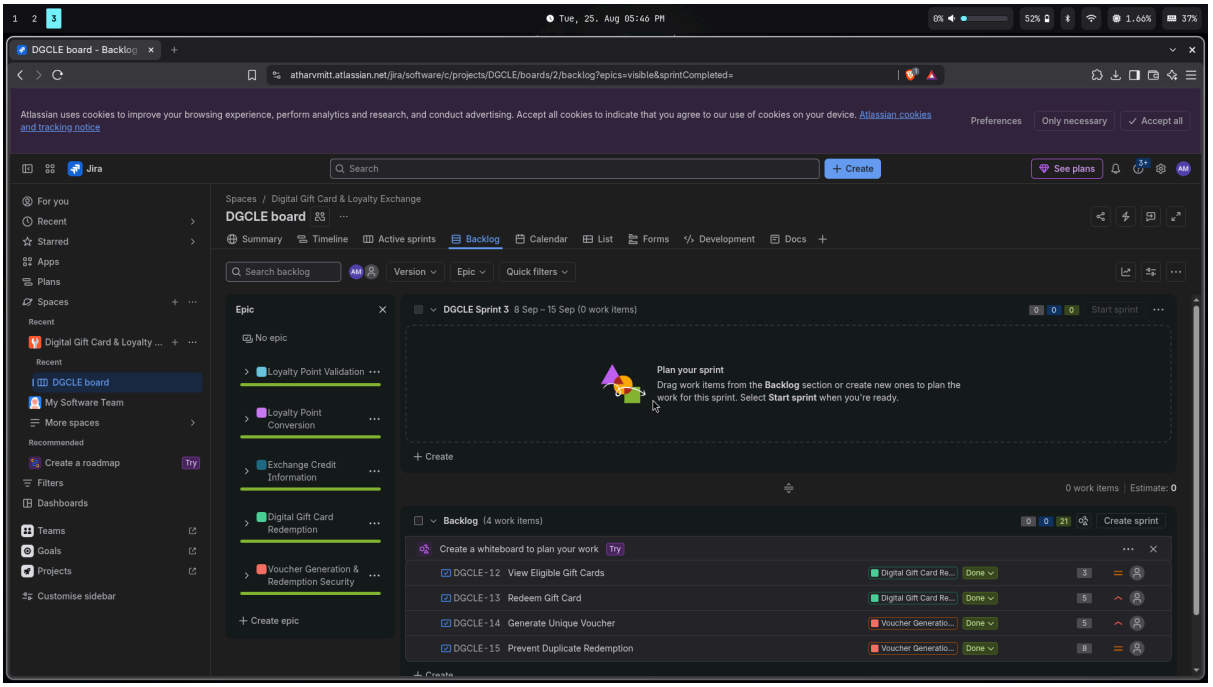

Active Sprint Board during Sprint 2:

Reflection answers:

1. Did your estimations reflect the actual effort?

Yes, the estimations were reasonably close to the actual effort. The story points helped us compare the relative complexity of the user stories before starting the sprint. The higher-point stories, such as **Prevent Duplicate Redemption (8 points)**, required more effort than the smaller stories. Overall, the completed sprint work was consistent with the estimated complexity.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized according to functionality and business importance. Core features such as viewing eligible gift cards and redeeming gift cards were prioritized before security-related voucher features. This allowed the essential gift-card functionality to be addressed first while keeping security features organized for subsequent work.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned well with the planned work. The selected user stories were completed during the sprint and moved through the workflow from **To Do → In Progress → Done**. Sprint 2 was completed with all four planned work items completed, showing that the sprint scope was achievable.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart is intended to show how quickly the team completed the planned work and whether the remaining workload was decreasing at the expected rate. From the sprint completion results, the team was able to complete all planned Sprint 2 work, indicating that the selected sprint scope was manageable.
